Sulfur dioxide (SO_2) is released into the atmosphere primarily through the combustion of sulfur-containing fossil fuels. When SO_2 reacts with water vapor in the atmosphere, it forms sulfuric acid (H_2SO_4), contributing to acid rain. The reactions involve oxidation of SO_2 to SO_3 , which then reacts with water:

This acid can lower the pH of rainwater, leading to environmental damage.

To detect SO_2 in atmospheric samples, one common method is gas chromatography (GC) coupled with a suitable detector. Alternatively, absorption spectroscopy can be used, where SO_2 absorbs specific wavelengths of light, and the concentration is determined by measuring absorbance against a calibration curve.
