QuestionAnswer What is the formula for calculating molarity in chemistry? Molarity (M) = Number of moles of solute / Volume of solution in liters. How do you calculate the empirical formula from percentage composition? Convert percentages to grams, find moles of each element, then divide by

the smallest number of moles to get the empirical formula. What is the formula for calculating pH from hydrogen ion concentration? $\text{pH} = -\log[\text{H}^+]$, where $[\text{H}^+]$ is the concentration of hydrogen ions in moles per liter. How do you determine the molecular formula from the empirical formula and molar mass? Calculate the molar mass of the empirical formula, then divide the molecular weight by the empirical formula weight to find the multiplier. Multiply the empirical formula subscripts by this multiplier to get the molecular formula. What is the formula for calculating percentage composition? Percentage of an element = $(\text{Mass of element in compound} / \text{Molar mass of compound}) \times 100$. How is the ideal gas law formula expressed? $PV = nRT$, where P = pressure, V = volume, n = number of moles, R = gas constant, T = temperature in Kelvin. What is the formula for calculating boiling point elevation? $\Delta T_b = i \times K_b \times m$, where ΔT_b is the boiling point elevation, i is the van 't Hoff factor, K_b is the ebullioscopic constant, and m is molality. How do you compute the rate constant from reaction data? Using the rate law expression $\text{rate} = k [\text{reactants}]^n$, rearranged to find $k = \text{rate} / [\text{reactants}]^n$, based on experimental data. What is the formula for calculating the oxidation number? Oxidation number rules vary, but generally, for a simple ion, it's equal to its charge; for molecules, assign electrons based on electronegativity differences, following standard rules. How do you find the equivalent weight of an acid or base? Equivalent weight = Molar mass / number of hydrogen ions (H^+) or hydroxide ions (OH^-) replaced per molecule in a reaction.
