Algebra and Equations

Question Example:

Solve for x: $2x^2 - 5x + 3 = 0$.

Solution Approach:

- Use quadratic formula: $x = [5 \pm \sqrt{25 - 24}] / 4$
- Simplify discriminant: $\sqrt{1} = 1$
- Find roots: $x = (5 \pm 1) / 4$

Expected Answer:

$x = 1.5$ or $x = 0.5$

Geometry

Question Example:

In a triangle ABC, angles A and B are 50° and 60° , respectively. Find angle C.

Solution:

- Sum of angles in a triangle = 180°
- Angle C = $180^\circ - (50^\circ + 60^\circ) = 70^\circ$

Key Learning:

Understanding the properties of triangle angles is fundamental.

Trigonometry

Question Example:

Given $\sin \theta = 3/5$, find $\cos \theta$.

Solution:

- Use Pythagoras: $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (9/25)} = \sqrt{(16/25)} = 4/5$

Note: Consider the quadrant for the sign of $\cos \theta$ if specified.

Statistics and Probability

Question Example:

The scores of 50 students in a test have a mean of 70. If 5 students scored 80, find the average score of the remaining students.

Solution:

- Total sum = $50 \times 70 = 3500$
- Sum of 5 students' scores = $5 \times 80 = 400$
- Remaining students' total = $3500 - 400 = 3100$
- Average of remaining students = $3100 / 45 \approx 68.89$
