- **Evolution:** Populations evolve over generations through genetic changes.

Cell Biology

Cells are the fundamental units of life. Understanding cell structure and function is crucial for grasping broader biological concepts.

Types of Cells

There are two primary types:

- **Prokaryotic Cells:** These are simple, unicellular organisms like bacteria and archaea. They lack a nucleus and membrane-bound organelles.

Genetics and Heredity

Genetics explains how traits are inherited and how genetic information is passed from one generation to the next.

DNA Structure and Function

Deoxyribonucleic acid (DNA) is the molecule that carries genetic instructions. Its structure is a double helix composed of nucleotide bases: adenine, thymine, cytosine, and guanine.

Genetic Inheritance

Key principles include:

- **Dominant and recessive alleles:** Traits are expressed depending on allele combinations.
