Types of Assignable Macroeconomics Questions and Corresponding Answers

Conceptual Questions

These questions test students' understanding of fundamental macroeconomic concepts. Examples include:

- What is Gross Domestic Product (GDP), and how is it calculated?
- Explain the difference between nominal and real GDP.
- Describe the main tools used by central banks to control inflation.

Sample Answer:

Gross Domestic Product (GDP) measures the total value of all goods and services produced within a country's borders over a specific period. It is calculated using three approaches: the production (or output) approach, income approach, and expenditure approach. The expenditure approach sums consumption, investment, government spending, and net exports. Understanding GDP helps policymakers gauge economic activity and growth.

Quantitative and Problem-Solving Questions

These involve numerical problems that require applying formulas and economic models.

- Calculate the unemployment rate given the number of unemployed and the labor force.
- Determine the impact of an increase in government spending on aggregate demand using the

Keynesian model.

- Using the Phillips Curve, analyze the trade-off between inflation and unemployment.

Sample Answer:

If the number of unemployed individuals is 10 million and the labor force is 150 million, the unemployment rate is $(10 \text{ million} / 150 \text{ million}) \times 100 = 6.67\%$. This percentage indicates the proportion of the labor force actively seeking employment but unable to find work.

Discussion and Essay Questions

These questions promote critical thinking and application of macroeconomic theories.

- Discuss the long-term effects of expansionary monetary policy on economic growth and inflation.
- Evaluate the pros and cons of fiscal stimulus during a recession.
- Analyze how supply-side policies can influence productivity and economic output.

Sample Answer:

Expansionary monetary policy, such as lowering interest rates, can stimulate economic growth by encouraging borrowing and investment. However, if overused, it may lead to higher inflation. In the long term, sustained expansion can support job creation and productivity, but policymakers must balance these benefits against potential inflationary pressures.

Sample Instructor Assignable Answer: An Example

Question:

Determine the impact of an increase in government spending on aggregate demand and overall economic output in a closed economy using the Keynesian Cross model.

Answer:

Restatement:

The question asks how an increase in government expenditure affects aggregate demand (AD) and real GDP in a closed economy, employing the Keynesian Cross framework.

Theoretical Background:

In a Keynesian Cross model, aggregate demand (AD) is represented by the sum of autonomous spending and induced consumption. The equilibrium level of income (Y) occurs where planned spending equals actual output.

Step 1: Define the expenditure function

Let's assume the consumption function is:

$$C = C_0 + cY$$

where:

- C_0 = autonomous consumption
- c = marginal propensity to consume (MPC), $0 < c < 1$

Government spending is denoted as G .

Total planned expenditure (E) is:

$$E = C + I + G$$

In a simplified model with no investment or net exports, this reduces to:

$$E = C + G = C_0 + cY + G$$

Step 2: Find equilibrium income

Equilibrium occurs when planned expenditure equals actual income:

$$Y = E$$

$$Y = C_0 + cY + G$$

Rearranged:

$$Y - cY = C_0 + G$$

$$Y(1 - c) = C_0 + G$$

$$Y^* = \frac{C_0 + G}{1 - c}$$

Step 3: Analyze the impact of increased G

Suppose G increases from G_1 to G_2 . The new equilibrium income becomes:

$$Y_2^* = \frac{C_0 + G_2}{1 - c}$$

The change in income:

$$\Delta Y = Y_2^* - Y_1^* = \frac{G_2 - G_1}{1 - c}$$

Step 4: Interpretation and policy implications

- The increase in government spending directly raises aggregate demand.
- The multiplier effect magnifies the impact on total output: the larger the MPC (c), the greater the multiplier ($\frac{1}{1 - c}$).
- For example, if $c = 0.8$, a \$1 billion increase in G leads to a \$5 billion increase in GDP.

Visual Aid:

Insert a Keynesian Cross diagram showing the upward shift in the planned expenditure line and the new equilibrium point.

Summary:

An increase in government spending in a closed economy raises aggregate demand and, through the multiplier effect, significantly boosts overall real GDP. The magnitude of this impact depends on the marginal propensity to consume.

Conclusion and Best Practices

Instructor assignable macroeconomics answers serve as essential pedagogical tools that reinforce learning, facilitate assessment, and clarify complex concepts. To maximize their effectiveness:

- Ensure accuracy and clarity in explanations.
- Use diagrams and data judiciously to enhance understanding.
- Link theoretical insights to real-world examples.

Sample Breakdown of a Typical Problem and Its Solution

To illustrate the depth and clarity of Romer's solutions, consider a common problem: deriving the steady-state level of capital in a Solow growth model with technological progress.

Problem Statement:

Given a production function $Y = A K^{\alpha} L^{1-\alpha}$, where A grows exogenously at rate g_A , find the steady-state capital per worker k^* .

Step-by-Step Solution:

- Define Variables:
 - $k = K / L$ (capital per worker)

- $y = Y / L$ (output per worker)

- Express Production per Worker:

[

$$y = A k^{\alpha}$$

]

- Determine the Capital Accumulation Equation:

[

$$\dot{K} = sY - \delta K$$

]

In per-worker terms:

[

$$\dot{k} = s y - (\delta + g_L) k$$

]

where (g_L) is the growth rate of labor (assumed zero here for simplicity).

- Incorporate Technological Progress:

Since (A) grows at rate (g_A) , the effective capital per worker must account for technological change:

[

$$\dot{k} = s A k^{\alpha} - (\delta + g_A) k$$

]

- Steady-State Condition:

At steady state:

\[

$$0 = s A k^{\alpha} - (\delta + g_A) k$$

\]

- Solve for k^* :

\[

$$s A k^{\alpha} = (\delta + g_A) k$$

\]

\[

$$s A k^{\alpha - 1} = \delta + g_A$$

\]

\[

$$k^* = \left(\frac{s A}{\delta + g_A} \right)^{\frac{1}{1-\alpha}}$$

\]

Final Explanation:

This derivation shows how the steady-state capital per worker depends on saving rate s , productivity level A , depreciation δ , and technological growth g_A . The solution emphasizes the importance of technological progress in sustaining growth and capital accumulation.
