Vector Space Model

Here, documents and queries are represented as vectors in a multidimensional space, with relevance calculated based on measures like cosine similarity. This model supports ranked retrieval, providing the most relevant documents first.

Indexing and Data Structures

Effective retrieval relies heavily on indexing techniques that allow quick access to stored data.

- **PageRank and Similar Algorithms:** Used in web search engines to evaluate the importance of pages based on link structures.

System Architectures and Components

Types of Storage Systems

Depending on application needs, systems may utilize different storage architectures:

- **Centralized Storage:** All data resides on a single server or system, suitable for small-scale applications.
- **Distributed Storage:** Data is spread across multiple nodes, offering scalability and fault tolerance.
- **Cloud Storage:** Leveraging remote servers accessible via the internet, enabling flexible and scalable storage solutions.

Retrieval System Components

A typical retrieval system comprises:

- **Document Collection:** The corpus of data to be stored and searched.
