Sample Questions and Answers from the Orbital Motion Gizmo Answer Key

Question 1: What happens to the orbital period if the orbital radius is doubled?

Answer: According to Kepler's Third Law, the orbital period increases proportionally to the $3/2$ power of the orbital radius. Therefore, doubling the radius results in the period increasing by a factor of approximately 2.83, meaning the satellite takes longer to complete one orbit.

Question 2: How does increasing the mass of the central body affect the orbital velocity of the satellite?

Answer: Increasing the mass of the central body increases the gravitational force, which results in a

higher required orbital velocity for the satellite to maintain its orbit. The relationship is directly proportional; more mass means higher velocity needed.

Question 3: Why does a satellite in a low Earth orbit travel faster than one in a higher orbit?

Answer: A satellite in a lower orbit experiences a stronger gravitational pull due to its proximity to Earth. To balance this force and stay in orbit, it must travel faster. Conversely, satellites in higher orbits require lower velocities because the gravitational force weakens with distance.

Common Half-Life Gizmo Questions and Solutions

Understanding typical questions can prepare students to navigate the Gizmo effectively. Below are

some frequently encountered problems along with detailed solutions.

Question 1: Calculating Remaining Radioactive Material

Problem:

A sample initially contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution:

The decay follows exponential decay formula:

$$N = N_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

Where:

- $N_0 = 100$ grams
- $T_{1/2} = 10$ hours
- $t = 30$ hours

Calculations:

$$N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

Answer:

12.5 grams of the isotope remain after 30 hours.

Question 2: Determining the Half-Life from Data

Problem:

A sample of a radioactive material decays from 80 grams to 20 grams in 24 hours. What is its half-life?

Solution:

The decay from 80g to 20g involves two half-lives:

$[80 \rightarrow 40 \rightarrow 20]$

Number of half-lives: 2

Time for two half-lives: 24 hours

Therefore,

$$T_{1/2} = \frac{24 \text{ hours}}{2} = 12 \text{ hours}$$

Answer:

The half-life of the substance is 12 hours.

Question 3: Interpreting Decay Graphs

Problem:

Given a decay curve that shows the remaining amount of a substance over time, how can you estimate the half-life?

Solution:

Steps:

- Find the initial amount on the y-axis (N_0).
- Locate the point where the remaining amount is approximately half of N_0 .
- Trace horizontally from this point to meet the decay curve, then go vertically down to the x-axis.
- The corresponding time on the x-axis is an estimate of the half-life.

Tip:

Using gridlines or digital tools can improve accuracy.
