Examples of Thermodynamics Van Wylen 7th Exercises Solutions

Below, we present detailed solutions to representative exercises, illustrating the step-by-step approach.

Example 1: Work Done in an Isothermal Expansion of an Ideal Gas

Problem Statement:

An ideal gas undergoes an isothermal expansion at 300 K from an initial volume of 1 m³ to a final volume of 3 m³. Calculate the work done by the gas during this process.

Solution:

Step 1: Identify Known Data

- Temperature, $T = 300 \text{ K}$
- Initial volume, $V_1 = 1 \text{ m}^3$
- Final volume, $V_2 = 3 \text{ m}^3$
- Ideal gas constant, $R = 8.314 \text{ kJ/kmol}\cdot\text{K}$ (or use specific gas constant depending on the gas)

Step 2: Determine the Gas Constant for the Gas

Assuming the gas is air with molar mass $M = 28.97 \text{ g/mol}$, the specific gas constant:

$$R_{\text{specific}} = R / M = 8.314 / 0.02897 = 287 \text{ J/kg}\cdot\text{K}$$

Step 3: Apply the Work Formula for Isothermal Process

For an ideal gas undergoing an isothermal process:

$$W = nRT \ln \left(\frac{V_2}{V_1} \right)$$

Alternatively, using specific quantities:

$$W = m R_{\text{specific}} T \ln \left(\frac{V_2}{V_1} \right)$$

Assuming unit mass ($m=1 \text{ kg}$):

$$W = 1 \times 287 \times 300 \times \ln(3/1)$$

Calculating:

$$W = 287 \times 300 \times 1.0986 = 287 \times 329.58 = 94,675 \text{ J}$$

Answer:

The work done by the gas is approximately 94.7 kJ.

Step 4: Final Verification

- The work is positive, indicating work done by the gas during expansion.
- Units are consistent.

- The result aligns with thermodynamic principles for isothermal expansion.

Example 2: Entropy Change in a Heating Process

Problem Statement:

A 2 kg block of water is heated from 20°C to 100°C in a constant pressure process. The specific heat capacity of water is 4.18 kJ/kg·K. Calculate the entropy change of the water.

Solution:

Step 1: Convert Temperatures to Kelvin

- $T_1 = 20^\circ\text{C} = 293.15\text{ K}$
- $T_2 = 100^\circ\text{C} = 373.15\text{ K}$

Step 2: Use the Entropy Change Formula for a Reversible Heating Process

$$\Delta S = m c_p \ln \frac{T_2}{T_1}$$

Step 3: Substitute Values

$$\Delta S = 2 \times 4.18 \times \ln \frac{373.15}{293.15}$$

Calculate the logarithm:

$$\ln \left(\frac{373.15}{293.15} \right) \approx \ln(1.273) \approx 0.241$$

Now, compute:

$$\Delta S \approx 2 \times 4.18 \times 0.241 \approx 2 \times 1.007 \approx 2.014 \text{ kJ/K}$$

Answer:

The entropy of the water increases by approximately 2.01 kJ/K.

This pedagogical focus ensures learners develop both problem-solving skills and thermodynamic intuition.

Examples of Typical Exercises and Their Solutions

To illustrate the depth and utility of Van Wylen's solutions, let's consider an example exercise typical for the textbook, along with an overview of its comprehensive solution.

Example Exercise: Isentropic Expansion of an Ideal Gas

Problem Statement:

A piston-cylinder device contains 0.5 kg of an ideal gas initially at 300 K and 200 kPa. The gas undergoes an isentropic expansion to a final pressure of 100 kPa. Determine:

- The final temperature of the gas.
- The work done during the process.

Step 1: Restate Known Data and Find Unknowns

- Initial state:
 - $(P_1 = 200 \text{ kPa})$
 - $(T_1 = 300 \text{ K})$
 - $(m = 0.5 \text{ kg})$
- Final pressure:
 - $(P_2 = 100 \text{ kPa})$
- Unknowns:
 - (T_2) : Final temperature.
 - (W_{12}) : Work done by the gas.

Step 2: Recognize the Process Type

- Isentropic expansion of an ideal gas suggests:

[

$$PV^\gamma = \text{constant} \quad \text{or} \quad TP^{1-\gamma} = \text{constant}$$

]

where γ is the specific heat ratio.

Step 3: Calculate Final Temperature T_2

Using the relation:

$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1} \right)^{(\gamma - 1)/\gamma}$$

Assuming the gas is air, $\gamma = 1.4$.

Calculations:

$$T_2 = 300 \text{ K} \times \left(\frac{100}{200} \right)^{(0.4/1.4)} = 300 \text{ K} \times (0.5)^{0.2857}$$

$$T_2 \approx 300 \text{ K} \times 0.814 = 244.2 \text{ K}$$

Result: The final temperature is approximately 244.2 K.

Step 4: Calculate Work Done W_{12}

For an ideal gas undergoing an isentropic process:

$$W_{12} = m R (T_1 - T_2)$$

Where:

- $R =$ specific gas constant for air $\approx 0.287 \text{ kJ/kg}\cdot\text{K}$.

Calculations:

[

$$W_{12} = 0.5 \text{ kg} \times 0.287 \text{ kJ/kg}\cdot\text{K} \times (300 \text{ K} - 244.2 \text{ K}) \approx 0.5 \times 0.287 \times 55.8$$

]

[

$$W_{12} \approx 0.5 \times 16.02 = 8.01 \text{ kJ}$$

]

Result: The work done by the gas during expansion is approximately 8.01 kJ.

Step 5: Verify and Interpret Results

- The temperature decrease aligns with the expectation for expansion.
- The work value makes physical sense for the given mass and conditions.

How the Solutions Enhance Learning

This example demonstrates several key advantages of Van Wylen's detailed solutions:

- Clarity in stepwise reasoning: Each step logically follows from the previous, reinforcing problem-solving methodology.
- Explicit assumptions: Use of ideal gas law and isentropic relations are justified and explained.
- Calculation transparency: All equations and numerical steps are shown, allowing learners to follow and replicate.
- Conceptual insights: The solution elucidates how pressure, temperature, and work relate in idealized processes.

Introduction to the Borgnakke Model

The Borgnakke model is a statistical approach used in the analysis of thermodynamic cycles, particularly in modeling the behavior of gases during processes involving phase changes, mixing, and energy redistribution. It is especially useful in the context of internal combustion engines, gas turbines, and refrigeration cycles, where the distribution of energy among particles influences overall efficiency and performance.

Core Principles of the Borgnakke Solution

- **Energy Redistribution:** The model assumes that during inelastic collisions, energy is redistributed among molecules according to statistical probabilities, leading to a new equilibrium distribution.

- **Maxwell-Boltzmann Distribution:** It employs this distribution to describe molecular velocities and energies post-collision, reflecting the probability of particles having certain energies.

- **Collision Models:** The solution considers both elastic and inelastic collisions, with inelastic collisions allowing energy exchange between translational, rotational, and vibrational modes.

- **Phase Change Modeling:** It facilitates the analysis of phase change phenomena by modeling the energy partitioning during vaporization or condensation processes.

Mathematical Foundations of the Borgnakke Solution

The solution relies on statistical mechanics and thermodynamics principles, notably:

- **Probability Distributions:** To determine the likelihood of particles having specific energies after collisions.

- **Energy Conservation:** Ensuring total energy remains constant during collisions and phase changes.

- **Partitioning of Energy:** Dividing energy among various modes (translational, rotational, vibrational) based on temperature and molecular properties.

While it requires dedication due to its depth, the rewards include a robust foundation that can be applied across numerous engineering domains.

For those seeking a thorough, reliable, and well-organized textbook that emphasizes understanding fundamental principles while illustrating their practical relevance, this edition remains a top choice. Its continued updates and thoughtful presentation ensure it remains relevant in the evolving landscape of thermodynamics education and industry applications.

Question What are the key principles of the first law of thermodynamics as explained in Borgnakke and Sonntag's 'Fundamentals of Thermodynamics' 8th edition? The first law of thermodynamics states that energy cannot be created or destroyed, only transferred or converted. In Borgnakke and Sonntag's book, it emphasizes the conservation of energy in closed and open systems, accounting for work, heat transfer, and internal energy changes. How does Borgnakke and Sonntag 8th edition describe the concept of entropy and its significance in thermodynamics? The book explains entropy as a measure of disorder or randomness within a system, highlighting its role in dictating the direction of spontaneous processes. It emphasizes the second law of thermodynamics, which states that entropy tends to increase in isolated systems, influencing efficiency and irreversibility. What are the different types of thermodynamic processes covered in Borgnakke and Sonntag's 8th edition? The book covers various processes including isobaric, isochoric, isothermal, adiabatic, and polytropic processes. It discusses their characteristics, equations, and how they relate to real-world thermodynamic systems. How does Borgnakke and Sonntag approach the analysis of power cycles such as Carnot, Rankine, and Brayton cycles? The textbook provides detailed analysis of these cycles, illustrating their thermodynamic processes, efficiencies, and practical applications. It emphasizes the importance of understanding each cycle's idealized assumptions and real-world modifications. What mathematical tools and diagrams are emphasized in Borgnakke and Sonntag's 'Fundamentals of Thermodynamics' 8th edition for understanding thermodynamic principles? The book emphasizes the use of PV diagrams, T-s diagrams, and entropy charts to visualize thermodynamic processes. It also highlights the importance of equations of state, energy balance equations, and property tables for accurate analysis.
