Fundamental Principles in Physical Hydrology Hendriks

Hendriks' methodology is rooted in classical physics, applying laws such as Darcy's law and conservation of mass to describe water flow.

Darcy's Law

This fundamental principle states that the flow rate of water through a porous medium is proportional to the hydraulic gradient and the medium's permeability:

- Flow rate (Q): $Q = -K \times A \times \frac{dh}{dl}$

Where:

- K = hydraulic conductivity
- A = cross-sectional area
- $\frac{dh}{dl}$ = hydraulic gradient

Hendriks refined the application of Darcy's law in heterogeneous soils, accounting for variable permeability.

Water Balance Equation

The water balance is expressed as:

- Change in storage = Inflows - Outflows

Mathematically:

$$\frac{\partial \theta}{\partial t} = I - O$$

Where:

- θ = volumetric water content
- I = inflow (precipitation, recharge)

- (O) = outflow (evapotranspiration, runoff, percolation)

Hendriks integrated these principles into models that simulate temporal and spatial water movement.

Modeling Techniques in Physical Hydrology Hendriks

Hendriks' work emphasizes the development and application of models to predict water behavior under various environmental conditions.

Analytical Models

These models provide solutions based on simplified assumptions, useful for understanding fundamental processes:
