Sample Problems and Solutions from the Chemlab 16 Calorimetry Answer Key

Problem 1: Calculating Heat Absorbed by Water

Question: A 50 g sample of water is heated from 20°C to 80°C. What is the amount of heat absorbed?

Solution:

- Identify known values:

- $m = 50 \text{ g} = 0.05 \text{ kg}$

- $c = 4186 \text{ J/kg}\cdot^\circ\text{C}$ (specific heat of water)

- $\Delta T = 80^\circ\text{C} - 20^\circ\text{C} = 60^\circ\text{C}$

- Apply the formula:

$$Q = mc\Delta T$$

- Calculate:

$$Q = 0.05 \text{ kg} \times 4186 \text{ J/kg}\cdot^\circ\text{C} \times 60^\circ\text{C} = 12,558 \text{ J}$$

Answer: The water absorbs approximately 12,558 Joules of heat.

Problem 2: Determining Enthalpy Change in a Reaction

Question: In a calorimetry experiment, 100 mL of a substance with a density of 1 g/mL is heated, and the temperature increases by 15°C. If the specific heat capacity is 2.0 J/g·°C, what is the enthalpy change?

Solution:

- Calculate the mass:

- Mass = volume × density = 100 mL × 1 g/mL = 100 g

- Use the heat formula:

$$Q = mc\Delta T = 100 \text{ g} \times 2.0 \text{ J/g}\cdot^{\circ}\text{C} \times 15^{\circ}\text{C} = 3,000 \text{ J}$$

- Interpretation:

- The enthalpy change ΔH = 3,000 J (assuming constant pressure and no heat loss)

- **Liquid:** Has a definite volume but takes the shape of its container. Particles are loosely packed and can move around each other.
- **Gas:** Has neither a definite shape nor volume. Particles are far apart and move freely.

Some sciences also consider plasma as a fourth state, which is a high-energy state of matter.

Types of Matter: Pure Substances and Mixtures

Matter can be categorized into:

- **Pure Substances:** Consist of only one type of particle. Examples include elements like oxygen (O_2) and compounds like water (H_2O).
- **Mixtures:** Comprise two or more substances physically combined. They can be homogeneous (solutions) or heterogeneous.

Changes in Matter: Types and Characteristics

Physical Changes

Physical changes alter the form or appearance of a substance without changing its chemical composition. Examples include melting, freezing, vaporization, condensation, crushing, and dissolving.

Key features of physical changes:

Case Study: Balancing Chemical Equations

Incorrect Answer: An answer suggests balancing the combustion of methane as $\text{CH}_4 + \text{O}_2 \rightarrow \text{CO}_2 + \text{H}_2\text{O}$ without proper coefficients, leading to unbalanced atoms.

Proper Approach:

- Count atoms for each element on both sides:
 - Carbon: 1 on both sides.
 - Hydrogen: 4 on the left, 2 on the right.
 - Oxygen: 2 on the left, 2 in CO_2 + 1 in H_2O on the right.
- Balance hydrogen by placing a coefficient of 2 in H_2O : $\text{CH}_4 + \text{O}_2 \rightarrow \text{CO}_2 + 2 \text{H}_2\text{O}$.
- Balance oxygen: 2 in O_2 , 2 in CO_2 , 2 in $2 \text{H}_2\text{O}$, total 4.

- Place 2 in O?: $\text{CH}_4 + 2 \text{O}_2 \rightarrow \text{CO}_2 + 2 \text{H}_2\text{O}$.

This detailed process exemplifies the importance of step-by-step solutions over mere answers.

Question What is the difference between physical and chemical changes in matter?
Answer Physical changes alter the form or appearance of a substance without changing its chemical composition, such as melting or freezing. Chemical changes involve a change in the substance's chemical identity, resulting in the formation of new substances, like rusting or combustion. How can you identify a chemical change in an experiment? Indicators of a chemical change include color change, gas production, formation of a precipitate, temperature change, or emission of light. Observing one or more of these signs suggests a chemical reaction has occurred. What are some common examples of matter undergoing physical change? Common examples include tearing paper, melting ice, boiling water, dissolving sugar in tea, and crushing a can. These changes do not alter the chemical properties of the substances involved. Why is the conservation of mass important in chemical reactions? The conservation of mass states that mass cannot be created or destroyed in a chemical reaction. This principle helps chemists balance chemical equations and understand that all reactants' mass must equal the total mass of products. How does a chemist use lab techniques to identify different types of matter? Chemists use lab techniques such as spectroscopy, chromatography, and chemical testing to analyze the properties of substances, identify their composition, and determine whether they are elements, compounds, or mixtures.
