Introduction: The Significance of the 50th Anniversary in Function Theory

Reaching the fiftieth year in any scientific discipline is a milestone that prompts both reflection and future planning. For function theory, this anniversary underscores the maturity of the field, its foundational contributions to modern mathematics, and its intersections with other domains such as dynamical systems, number theory, and mathematical physics.

Over the past five decades, researchers have addressed classical problems like the Bieberbach conjecture, established deep connections with geometric function theory, and expanded the scope to include modern topics like quasiconformal mappings and Teichmüller theory. Yet, amidst these achievements, numerous open questions and research problems persist, fueling ongoing investigations.

Core Research Problems in Function Theory

The spectrum of research problems in function theory is broad, spanning classical conjectures to modern computational challenges. These problems can be broadly categorized into several themes:

- Geometric Function Theory and Univalent Functions
- Complex Dynamics and Iteration
- Holomorphic and Meromorphic Function Characterization
- Operator Theory and Function Spaces
- Extremal Problems and Coefficient Estimates

Let's delve into each of these categories in detail.

Geometric Function Theory and Univalent Functions

The Classical Univalent Function Problem

Univalent functions, injective holomorphic functions on a domain, are central to geometric function theory. The class of normalized univalent functions on the unit disk, denoted by S , has been the focus of extensive research.

Research Problem: Characterize the boundary behavior and coefficient bounds of functions in S .

Background & Importance: The Bieberbach conjecture, proved by de Branges in 1985, was a milestone in understanding the coefficient problem for univalent functions. Yet, many related questions remain open:

- Sharp coefficient bounds for subclasses of S , such as starlike, convex, and close-to-convex functions.
- Distortion and growth estimates for these subclasses.
- Boundary regularity and the nature of boundary points for extremal functions.

The Coefficient Problem and the Milin Conjecture

The coefficient problem involves understanding the bounds of coefficients in the Taylor expansion of univalent functions:

$\{$

$$f(z) = z + a_2 z^2 + a_3 z^3 + \dots$$

$\}$

Open Problems:

- Extending coefficient bounds to multivalent functions.
- Investigating the extremal functions that achieve these bounds.
- Exploring the implications of coefficient estimates on the geometric properties of functions.

The Role of Loewner Theory and its Extensions

Loewner's differential equation has been instrumental in solving classical problems. Recent research focuses on:

- Generalizations of Loewner chains to describe more complex classes of functions.
- Applications to conformal welding and shape optimization.

Complex Dynamics and Iteration

Julia Sets and Parameter Space Characterization

Complex dynamics involves studying the iteration of holomorphic functions, particularly rational maps.

Research Problems:
