Sample Multiple Choice Questions and Expert Analysis

To illustrate the depth and application of MCQs in OR, let's examine some representative questions, along with detailed explanations.

Question 1: Linear Programming Formulation

Which of the following is NOT a standard assumption in linear programming?

A) Proportionality between variables and their contribution to the objective function

- B) Certainty of data
- C) Non-negativity of decision variables
- D) Non-linearity of constraints

Correct Answer: D) Non-linearity of constraints

Expert Explanation:

Linear programming (LP) relies on several fundamental assumptions to ensure the problem remains linear and solvable via standard methods like the simplex algorithm. These assumptions include:

- Proportionality: The contribution of decision variables to the objective function and constraints must be directly proportional (e.g., coefficients are constants).
- Certainty: All data values are known with certainty.
- Non-negativity: Decision variables are often constrained to be non-negative, especially in resource allocation problems.

Non-linearity of constraints (option D) violates the core linearity principle, making the problem non-linear and requiring different solution approaches. Recognizing this helps in identifying whether a problem is suitable for LP or needs alternative techniques.

Question 2: Transportation Problem

In a balanced transportation problem, the total supply equals the total demand. Which method is typically used to find an initial feasible solution?

- A) Northwest Corner Method
- B) Vogel's Approximation Method
- C) MODI Method
- D) Both A and B

Correct Answer: D) Both A and B

Expert Explanation:

For balanced transportation problems, initial feasible solutions are often obtained using:

- Northwest Corner Method: A straightforward, heuristic approach starting from the top-left (northwest) cell, allocating as much as possible, then moving either right or down.
- Vogel's Approximation Method (VAM): A more refined heuristic that considers penalty costs to find a closer-to-optimal initial solution.

The MODI (Modified Distribution) method, on the other hand, is used for optimizing the transportation plan after initial feasibility is achieved. Both the Northwest Corner and VAM are valid initializers, making option D correct.

Question 3: Queueing Theory

In the M/M/1 queue model, the average number of customers in the system (L) is given by which of the following formulas?

A) $L = \frac{\lambda}{\mu - \lambda}$

B) $L = \frac{\lambda}{\mu}$

C) $L = \frac{\mu}{\mu - \lambda}$

D) $L = \frac{\lambda}{\mu + \lambda}$

Correct Answer: A) $L = \frac{\lambda}{\mu - \lambda}$

Expert Explanation:

The M/M/1 queue model assumes Poisson arrivals (λ) and exponential service times (μ). The average number of customers in the system, including those being served and waiting, is derived from the steady-state probabilities and is given by:

[

$$L = \frac{\rho}{1 - \rho} = \frac{\lambda / \mu}{1 - (\lambda / \mu)} = \frac{\lambda}{\mu - \lambda}$$

]

This formula is fundamental in queueing theory, helping managers estimate system congestion and optimize service rates.
