chemfiesta answers combined gas law

chemfiesta answers combined gas law is a popular topic among students studying chemistry, particularly those exploring the fundamental principles that govern the behavior of gases. Understanding the combined gas law is essential for mastering concepts related to gas laws, and chemfiesta provides valuable resources and answers that help clarify these principles. This article offers an in-depth explanation of the combined gas law, including its formula, applications, and how to solve related problems, ensuring students and enthusiasts can grasp the concept effectively.

Understanding the Combined Gas Law

The combined gas law is a fundamental principle in chemistry that relates the pressure, volume, and temperature of a fixed amount of gas. It essentially combines three individual gas laws—Boyle's Law, Charles's Law, and Gay-Lussac's Law—into a single comprehensive equation. This law allows us to predict how changes in one or more of these variables affect the others when the amount of gas remains constant.

Historical Context and Importance

Before diving into the specifics, it's important to recognize the historical development of gas laws:

- Boyle's Law: Describes the inverse relationship between pressure and volume at constant temperature.
- Charles's Law: Explains the direct relationship between volume and temperature at constant pressure.
- Gay-Lussac's Law: Details the direct relationship between pressure and temperature at constant volume.

The combined gas law synthesizes these relationships, providing a more versatile tool for solving real-world problems where multiple variables change simultaneously.

The Combined Gas Law Formula

The combined gas law is expressed mathematically as:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

where:

- P_1 and P_2 are the initial and final pressures,
- V_1 and V_2 are the initial and final volumes,
- T_1 and T_2 are the initial and final temperatures (measured in Kelvin).

This equation states that the ratio of the product of pressure and volume to temperature remains constant for a fixed amount of gas during any process involving simultaneous changes in these variables.

Key Points to Remember

- Temperatures must always be in Kelvin when using the combined gas law.
- The amount of gas (moles) remains constant; otherwise, the law does not apply.
- It's useful for solving problems where pressure, volume, and temperature change simultaneously.

Applications of the Combined Gas Law

The combined gas law has broad applications in various fields such as:

- Laboratory experiments: Predicting how gases behave under different conditions.
- Engineering: Designing systems involving pressurized gases.
- Meteorology: Understanding atmospheric pressure and temperature variations.
- Everyday life: Explaining phenomena like the expansion of a balloon in the heat or the compression of gases in a syringe.

Practical Examples

- Calculating the final pressure of a gas in a sealed container when heated.
- Determining the change in volume of a gas when pressure is increased at a constant temperature.
- Predicting how the pressure exerted by a gas in a tire varies with temperature changes.

Step-by-Step Guide to Solving Combined Gas Law Problems

To effectively solve problems involving the combined gas law, follow these systematic steps:

- Identify the known variables: $P?$, $V?$, $T?$, $P?$, $V?$, $T?$.
- Convert all temperatures to Kelvin:
 - Kelvin = Celsius + 273.15
- Write down the combined gas law formula.
- Plug in the known values into the formula.
- Solve for the unknown variable.
- Check units and reasonableness of the answer.

Example Problem

Problem:

A gas occupies a volume of 10.0 L at a pressure of 1.00 atm and a temperature of 25°C. If the gas is heated to 75°C and the pressure is increased to 2.00 atm, what is the new volume?

Solution:

- Identify knowns:

$$P_1 = 1.00 \text{ atm}$$

$$V_1 = 10.0 \text{ L}$$

$$T_1 = 25^\circ\text{C} = 298.15 \text{ K}$$

$$P_2 = 2.00 \text{ atm}$$

$$T_2 = 75^\circ\text{C} = 348.15 \text{ K}$$

$$V_2 = ?$$

- Apply the formula:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

- Plug in values:

$$(1.00 \text{ atm} \times 10.0 \text{ L}) / 298.15 \text{ K} = (2.00 \text{ atm} \times V_2) / 348.15 \text{ K}$$

- Solve for V_2 :

$$V_2 = (1.00 \text{ atm} \times 10.0 \text{ L} \times 348.15 \text{ K}) / (2.00 \text{ atm} \times 298.15 \text{ K})$$

$$V_2 = (10.0 \times 348.15) / (2.00 \times 298.15)$$

$$V_2 = (3481.5) / (596.3)$$

$$V_2 = 5.84 \text{ L}$$

Answer: The new volume of the gas is approximately 5.84 liters.

Common Mistakes and Tips

To ensure accuracy when working with the combined gas law, be aware of common pitfalls:

- Forgetting Kelvin: Always convert Celsius to Kelvin before calculations.
- Mixing units: Keep consistent units throughout (e.g., atm for pressure, liters for volume).
- Incorrect variable substitution: Double-check which variables are initial and which are final.
- Ignoring the constancy of moles: The law applies only when the amount of gas remains unchanged.

Tips for success:

- Write down knowns clearly before solving.
- Use a calculator carefully, especially when dealing with multiple steps.
- Practice with various problems to become familiar with different scenarios.

Sample Problem Breakdown

Problem Statement:

A gas occupies a volume of 10 liters at a pressure of 2 atm and a temperature of 300 K. If the pressure increases to 3 atm and the temperature rises to 350 K, what is the new volume?

ChemFiesta's step-by-step solution:

- Identify knowns and unknowns:

- $(P_1 = 2, \text{atm})$

- $(V_1 = 10, \text{L})$

- $(T_1 = 300, \text{K})$

- $(P_2 = 3, \text{atm})$

- $(T_2 = 350, \text{K})$

- $(V_2 = ?)$

- Write the combined gas law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

- Rearranged for (V_2) :

$$V_2 = \frac{P_1 V_1 T_2}{P_2 T_1}$$

$$V_2 = V_1 \times \frac{P_1}{P_2} \times \frac{T_2}{T_1}$$

\]

- Plugging in the known values:

\[

$$V_2 = 10\text{ L} \times \frac{2}{3} \times \frac{350}{300}$$

\]

- Calculating step-by-step:

$$\left(\frac{2}{3} \approx 0.6667 \right)$$

$$\left(\frac{350}{300} \approx 1.1667 \right)$$

$$\left(V_2 \approx 10 \times 0.6667 \times 1.1667 \right)$$

- Final calculation:

\[

$$V_2 \approx 10 \times 0.778 \approx 7.78\text{ L}$$

QuestionAnswer What is the combined gas law and how is it used in ChemFiesta? The combined gas law relates pressure, volume, and temperature of a gas and is used in ChemFiesta to solve problems involving changes in these variables when amount of gas remains constant. How do I apply the combined gas law in ChemFiesta questions? To apply the combined gas law, identify the initial and final conditions for pressure, volume, and temperature, then plug these into the formula

$P_1V_1/T_1 = P_2V_2/T_2$ and solve for the unknown variable. What is the formula for the combined gas law in ChemFiesta? The formula is $P_1V_1/T_1 = P_2V_2/T_2$, where P is pressure, V is volume, T is temperature in Kelvin, and the subscripts 1 and 2 represent initial and final states. Can I use the combined gas law for gases with changing amounts in ChemFiesta? No, the combined gas law assumes the amount of gas (moles) remains constant. For changing moles, use the ideal gas law with adjustments or the mole ratio. What are common mistakes to avoid when solving combined gas law problems in ChemFiesta? Common mistakes include not converting temperatures to Kelvin, mixing units for pressure and volume, and incorrectly rearranging the formula. Always double-check units and conversions. How does temperature conversion affect your answers in ChemFiesta combined gas law problems? Temperature must be converted to Kelvin because the law is based on absolute temperature. Using Celsius or Fahrenheit will lead to incorrect results. Is the combined gas law applicable to real gases in ChemFiesta? The combined gas law is an idealization assuming gases behave ideally. For real gases, deviations may occur at high pressures or low temperatures, and corrections might be necessary. How do I handle partial pressure when using the combined gas law in ChemFiesta? The combined gas law uses total pressure. If dealing with partial pressures, consider Dalton's law separately, but in most problems, use the total pressure values provided. What tips can help me efficiently solve combined gas law questions in ChemFiesta? Tip 1: Convert all temperatures to Kelvin. Tip 2: Use consistent units for pressure and volume. Tip 3: Write down known values clearly, and isolate the unknown variable before solving. Where can I find more practice problems on the combined gas law for ChemFiesta? You can find additional practice problems on the ChemFiesta platform, in chemistry textbooks, or online educational resources that focus on gas laws and their applications.
