Modelling and Control of Robot Manipulators: Advancing Precision and Flexibility in Automation

Introduction to Robot Manipulators

Robot manipulators are essential components in modern automation, capable of performing complex tasks with high precision and repeatability. They mimic human arm movements but with enhanced strength, speed, and endurance. The core of their effectiveness lies in accurate modeling and sophisticated control strategies. As industrial demands grow, so does the need for advanced techniques to improve manipulator performance, robustness, and adaptability.

Fundamentals of Manipulator Modelling

Understanding Kinematics

Kinematic modeling involves describing the robot's motion without considering forces or torques. It provides the relationship between joint parameters and the end-effector's position and orientation.

- Inverse Kinematics: Determines the necessary joint variables to achieve a desired end-effector pose. This is often more complex due to multiple solutions or singularities.

Methods and Tools:

- Denavit-Hartenberg (D-H) parameters: Standardized way to assign coordinate frames to links.

- Transformation matrices: Homogeneous matrices representing position and orientation.
- Numerical algorithms: Newton-Raphson, Jacobian inverse/transpose methods for solving inverse kinematics iteratively.

Dynamic Modelling

Dynamic models describe how the manipulator responds to forces and torques, considering mass, inertia, Coriolis, centrifugal, and gravity effects.

- Lagrangian Formulation: Derives equations of motion using kinetic and potential energy, leading to the well-known Euler-Lagrange equations.
- Newton-Euler Method: A recursive approach that computes velocities and accelerations, useful for real-time control.

Dynamic Equations:

$$\mathbf{M}(\mathbf{q}) \ddot{\mathbf{q}} + \mathbf{C}(\mathbf{q}, \dot{\mathbf{q}}) \dot{\mathbf{q}} + \mathbf{G}(\mathbf{q}) = \boldsymbol{\tau}$$

Where:

- $\mathbf{q}$: Joint variables
- $\mathbf{M}(\mathbf{q})$: Inertia matrix
- $\mathbf{C}(\mathbf{q}, \dot{\mathbf{q}})$: Coriolis and centrifugal matrix
