## Introduction to the Theory of Vibrations

### What Are Vibrations?

Vibrations are periodic motions of particles or systems about an equilibrium position. These oscillations can be:

- **Free vibrations:** Occur when a system is displaced and then allowed to oscillate without external force.
- **Forced vibrations:** Result from an external periodic force acting on the system.
- **Damped vibrations:** Experience energy loss over time due to internal or external damping forces.

### Importance of Studying Vibrations

Understanding vibrations helps in:

- Designing safer structures and machinery
- Preventing mechanical failures caused by resonance
- Optimizing performance and lifespan of mechanical systems
- Reducing noise and vibrations in various applications

# Fundamental Concepts in Vibrations Theory

## Single Degree of Freedom (SDOF) Systems

This is the simplest model, where a system's motion can be described by a single coordinate. The key parameters include:

- Mass ( $m$ )
- Stiffness ( $k$ )
- Damping coefficient ( $c$ )

## Equation of Motion

For an SDOF system, the differential equation governing free vibrations is:

$$m \frac{d^2x}{dt^2} + c \frac{dx}{dt} + kx = 0$$

where:

- $x(t)$ : Displacement as a function of time
- $m$ : Mass of the system
- $c$ : Damping coefficient
- $k$ : Stiffness of the system

## Types of Vibrations

Based on damping, vibrations are classified as:

- **Undamped:**  $c = 0$
- **Underdamped:**  $0 < c < 2\sqrt{km}$
- **Critically damped:**  $c = 2\sqrt{km}$
- **Overdamped:**  $c > 2\sqrt{km}$

## Solutions to the Vibrations Equations

### Free Undamped Vibrations

The solution is harmonic:

$$x(t) = A \cos(\omega t + \phi)$$

where:

- A: Amplitude
- $\omega$ : Natural frequency =  $\sqrt{k/m}$
- $\phi$ : Phase angle

## Free Damped Vibrations

The solution involves exponential decay:

$$x(t) = e^{(-\gamma t)} (A \cos(\omega_d t) + B \sin(\omega_d t))$$

where:

- $\gamma$ : Damping ratio =  $c / (2 \sqrt{km})$
- $\omega_d$ : Damped natural frequency =  $\omega \sqrt{1 - \gamma^2}$

## Forced Vibrations

When an external periodic force  $F(t) = F_0 \cos(\omega t)$  acts on the system, the steady-state response can be derived using impedance or phasor methods, leading to the concept of resonance when  $\omega$  approaches  $\omega_n$ .
