- Require a DC supply for their excitation.
- Used as generators in power plants and as synchronous motors in industrial applications.
- Advantages:
 - High efficiency.
 - Capable of power factor correction.
 - Suitable for large power applications.

2. Asynchronous Machines (Induction Machines)

- Operate at slip speed (slightly less than synchronous speed).
- No need for separate excitation.
- Widely used as motors in industries due to ruggedness and simplicity.
- Advantages:
 - Simplicity and low cost.
 - Robust construction.

Construction and Working Principles

Understanding the construction and working principles is vital for grasping how AC machines operate.

Synchronous Machines

- Stator: Contains a three-phase winding connected to the power supply.
- Rotor: Can be salient pole or cylindrical, with field windings supplied with DC excitation.
- Operation: The stator's rotating magnetic field induces a voltage in the rotor. The rotor's magnetic field locks with the stator's field, enabling synchronized rotation.

Induction Machines

Synchronous Machines:

- Based on the principle of magnetic induction and the interaction between the stator's rotating magnetic field and the rotor's magnetic field.
- When synchronized, the rotor's magnetic field aligns with the stator's rotating magnetic field, leading to steady torque.

Induction Machines:

- Rely on electromagnetic induction.
- The relative motion (slip) between the stator's rotating magnetic field and rotor induces currents in the rotor, producing torque.
- No need for slip rings or brushes, making them more durable.

Electrical Characteristics

Understanding key electrical parameters is essential:

- Back EMF (Electromotive Force): Voltage induced in the rotor or stator due to changing magnetic flux.
- Synchronous Reactance (X_s): Reactance due to the stator and rotor leakage flux.
- Armature Resistance (R_a): Resistance of the stator winding.
- Slip (for induction machines): The difference between synchronous speed and rotor speed expressed as a percentage.

Performance Parameters and Equations

Power Equations:

- Input Power (P_{in}): Power supplied to the machine.
- Output Power (P_{out}): Mechanical power developed (for motors).
- Efficiency (η): Ratio of output power to input power.

Torque Equation:

$\backslash$

$$T = \frac{3 \times E \times I \times \sin \phi}{\omega}$$

$\backslash$

Where:
