Their wind tunnel tests revealed crucial insights into lift and drag, which informed the design of their aircraft. This scientific approach distinguished the Wright brothers from earlier aviation pioneers who relied more on trial-and-error methods.

The Path to Powered Flight

The Wright Flyer: The First Powered Aircraft

Building upon their aerodynamic research, the Wright brothers designed and constructed their first powered aircraft, the Wright Flyer, in 1903. Key features of the Flyer included:

- **Engine:** A lightweight, custom-built engine designed by their mechanic, Charlie Taylor.
- **Propellers:** Carefully designed based on their aerodynamic data, providing efficient thrust.
- **Control system:** A three-axis control system allowing pitch, roll, and yaw adjustments.

The Wright Flyer was a biplane with a wingspan of 12.3 meters (40 feet) and a weight of around 274 kg (605 pounds). It incorporated their pioneering control innovations, notably the wing-warping system.

The Historic Flight at Kitty Hawk

On December 17, 1903, Orville Wright achieved the first controlled, sustained, powered flight with the Wright Flyer at Kill Devil Hills near Kitty Hawk, North Carolina. The historic flight lasted 12 seconds and covered 120 feet. Over the course of that day, they conducted three more flights, with the longest lasting 59 seconds and covering 852 feet.
