The compound is known for its relatively low solubility in water and its characteristic crystalline appearance, often used in laboratory and industrial settings.

Chemical Formula and Molecular Structure

The chemical formula of magnesium ethanoate encapsulates its composition:

This indicates that each magnesium ion pairs with two acetate ions to form the neutral compound. The molecular structure can be visualized as a magnesium center coordinated with two acetate groups, forming a stable ionic compound.

Determining the Formula: Theoretical Foundations

Atomic and Molecular Weight Calculations

Understanding the molecular weight of magnesium ethanoate is fundamental for preparing solutions, stoichiometric calculations, and quality control. The atomic weights (approximate, in unified atomic mass units - u) are:

- Magnesium (Mg): 24.305 u
- Carbon (C): 12.011 u
- Hydrogen (H): 1.008 u
- Oxygen (O): 15.999 u

Calculating the molecular weight of $Mg(CH_3COO)_2$:

- Magnesium: 24.305 u
- Acetate ion (CH_3COO^-):
 - Carbon: $12.011 \text{ u} \times 2$ (for two carbons in each acetate) = 24.022 u per acetate
 - Hydrogen: $1.008 \text{ u} \times 3$ (from methyl group) = 3.024 u per acetate

- Oxygen: $15.999 \text{ u} \times 2$ (from the two oxygens in acetate) = 31.998 u per acetate

- Total for one acetate: $24.022 + 3.024 + 31.998 = 59.044 \text{ u}$

- Since there are two acetate ions:

$$59.044 \text{ u} \times 2 = 118.088 \text{ u}$$

- Total molecular weight:

$$24.305 \text{ u (Mg)} + 118.088 \text{ u (two acetate ions)} = 142.393 \text{ u}$$

Therefore, the molecular weight of magnesium ethanoate is approximately 142.39 u .
