The circuit operates by monitoring the battery voltage and controlling the relay to connect or

disconnect the charger accordingly.

Operation Modes

The circuit generally works in two primary modes:

- Charging Mode
 - When the battery voltage drops below a set threshold, the NE555 timer outputs a high signal.
 - This energizes the relay coil, closing the contacts.
 - The charging source supplies current to the battery.
- Maintenance/Float Mode
 - When the battery reaches the desired full charge voltage, the sensing circuitry triggers the NE555 output to go low.
 - The relay de-energizes, disconnecting the charging source.
 - The system maintains the battery at a safe, float charge level, preventing overcharging.

Understanding the IC 555 Automatic Charger with Relay

What is the IC 555 Timer?

The 555 timer IC is a highly popular, versatile integrated circuit used for generating precise timing pulses and oscillations. It operates in three modes: monostable, astable, and bistable. In the context of an automatic charger, the 555 typically functions in monostable or astable mode, controlling relay activation based on the battery's charging status.

Role of the Relay in the Circuit

The relay acts as an electrically operated switch, enabling the control of high current loads (like a battery charger) using the low voltage control signal from the 555 timer. When the timer detects that the battery voltage drops below a set threshold, it activates the relay to connect the charging source; once charged, it deactivates the relay to prevent overcharging.
