cell growth and division vocabulary review

Understanding the fundamental concepts of cell growth and division is essential for students, educators, and anyone interested in biology. These processes are the backbone of life, enabling organisms to grow, develop, repair tissues, and reproduce. To navigate this complex subject effectively, a solid grasp of key vocabulary terms is crucial. This review will explore essential terminology related to cell growth and division, providing clear definitions and explanations to enhance comprehension and retention.

Introduction to Cell Growth and Division

Cell growth and division are vital biological processes that ensure the maintenance and continuation of life. Cells grow by increasing in size and synthesizing new molecules, and they divide through a carefully regulated process called mitosis (and meiosis for reproductive cells). These processes are governed by a specific set of terms and concepts that describe the stages, structures, and mechanisms involved.

Key Vocabulary Terms in Cell Growth and Division

To understand cell growth and division thoroughly, familiarize yourself with the following essential vocabulary:

Cell Cycle

- Definition: The series of events that take place in a cell leading to its division and duplication. It includes phases of growth, DNA replication, and division.
- Significance: Understanding the cell cycle is fundamental to comprehending how cells multiply and how their division is regulated.

Interphase

- Definition: The longest phase of the cell cycle during which the cell prepares for division. It is subdivided into three stages:

- G1 phase (First Gap): The cell grows and performs normal functions.
- S phase (Synthesis): DNA replication occurs, doubling the genetic material.
- G2 phase (Second Gap): The cell continues to grow and prepares for mitosis.
- Key Point: During interphase, the cell is metabolically active but not dividing.

Mitosis

- Definition: The process by which a somatic (body) cell divides to produce two genetically identical daughter cells.

- Stages of Mitosis:

- Prophase
- Metaphase
- Anaphase
- Telophase

- Purpose: Growth, tissue repair, and asexual reproduction.

Cytokinesis

- Definition: The final step in cell division where the cytoplasm divides, resulting in two separate cells.

- Note: Often overlaps with telophase of mitosis.

Chromosomes

- Definition: Structures within the nucleus composed of DNA and protein, carrying genetic information.

- In Mitosis: Condense and become visible under a microscope.

Chromatids

- Definition: Identical halves of a replicated chromosome, connected at the centromere.

Centromere

- Definition: The region where sister chromatids are held together and where spindle fibers attach during mitosis.

Spindle Fibers

- Definition: Microtubule structures that help separate chromosomes during mitosis.

G0 Phase

- Definition: A resting or quiescent state where cells exit the cycle and do not divide.
- Relevance: Some cells remain permanently in G0, such as nerve cells.

Tumor Suppressor Genes

- Definition: Genes that regulate cell division and prevent uncontrolled growth.
- Example: p53 gene.

Oncogenes

- Definition: Mutated genes that promote uncontrolled cell division, potentially leading to cancer.

Details of the Cell Cycle Phases

Understanding each phase's specific vocabulary helps clarify how cells progress through division.

G1 Phase

- Cells grow in size.
- Synthesize proteins needed for DNA replication.
- Decide whether to continue the cycle or enter G0.

S Phase

- DNA replication occurs.
- Each chromosome is duplicated, resulting in sister chromatids.
