All Solutions in Elementary Differential Equations Ninth Edition

Understanding Solutions of Differential Equations

Solutions to differential equations can be categorized broadly into:

- **General solutions:** Contain arbitrary constants, representing the family of all possible solutions
- **Particular solutions:** Specific solutions obtained by applying initial or boundary conditions
- **Singular solutions:** Solutions that cannot be obtained from the general solution but satisfy the differential equation

Types of Differential Equations and Their Solutions

First-Order Differential Equations

The first-order equations are typically the starting point. The solutions depend on the form of the equation:

- **Separable Equations:** Can be written as $\frac{dy}{dx} = g(x)h(y)$. Solutions involve integrating both sides:

$$\int \frac{1}{h(y)} dy = \int g(x) dx + C$$

- **Linear Equations:** Of the form $\frac{dy}{dx} + p(x)y = q(x)$. The solution involves an integrating factor $\mu(x) = e^{\int p(x) dx}$: $y(x) = \frac{1}{\mu(x)} \left(\int \mu(x) q(x) dx + C \right)$

- **Exact Equations:** When a differential equation can be written as $M(x,y) + N(x,y) \frac{dy}{dx} = 0$ with $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$. Solutions are found via potential functions: Find $\Psi(x,y)$: $\frac{\partial \Psi}{\partial x} = M$, $\frac{\partial \Psi}{\partial y} = N$

Higher-Order Differential Equations

The solutions involve solving characteristic equations for linear constant coefficient differential equations:

- Homogeneous equations like $a_n \frac{d^n y}{dx^n} + \dots + a_1 \frac{dy}{dx} + a_0 y = 0$
- Characteristic equation: $a_n r^n + \dots + a_1 r + a_0 = 0$
- Solutions depend on roots r :

- Distinct real roots: $y = C_1 e^{r_1 x} + C_2 e^{r_2 x} + \dots$
- Repeated roots: $y = (A + Bx) e^{rx}$
- Complex roots: $r = \alpha \pm i\beta$, solutions involve sines and cosines: $y = e^{\alpha x} (A \cos \beta x + B \sin \beta x)$

Special Methods for Specific Equations

The book details techniques like undetermined coefficients and variation of parameters for nonhomogeneous equations, which are essential for obtaining particular solutions.

- **Undetermined Coefficients:** Used when the nonhomogeneous term is of a specific form (polynomials, exponentials, sines, cosines)
- **Variation of Parameters:** A more general method applicable to a broader class of nonhomogeneous equations

Solution Sets and Their Characteristics

General Solutions and Arbitrary Constants

The general solution of a differential equation contains arbitrary constants corresponding to the order of the equation. These constants reflect the family of solutions satisfying the differential equation without initial conditions.

Particular Solutions and Initial Conditions

Applying initial conditions or boundary conditions allows determination of the arbitrary constants, resulting in a unique particular solution. This process involves substituting known values into the general solution and solving for constants.

Singular Solutions

Singular solutions are special solutions that are not obtainable from the general solution by assigning specific constants. They often arise from the integration process or as envelope solutions in certain problems.

Solution Techniques Emphasized in the Ninth Edition

Analytical Methods

The textbook emphasizes solving differential equations analytically whenever possible, providing step-by-step techniques for various classes of equations:

- Solve first-order equations via separation, linearity, or exactness
- Use characteristic equations for linear higher-order equations
- Apply method of undetermined coefficients or variation of parameters for nonhomogeneous equations
- Employ Laplace transforms for initial value problems involving discontinuities or complex solutions

Numerical and Qualitative Solutions

While analytical solutions are central, the book also introduces numerical methods such as Euler's method and Runge-Kutta algorithms to approximate solutions where exact solutions are difficult or impossible to find. Qualitative analysis methods, including phase plane analysis and stability considerations, help understand solution behavior without explicit formulas.

Examples of All Solutions in Practice

First-Order Example

Solve $\frac{dy}{dx} = xy$.

Solution:

Separate variables:

$$\int \frac{1}{y} dy = \int x dx$$

$$\Rightarrow \ln |y| = \frac{x^2}{2} + C$$

$$\Rightarrow y = \pm e^C e^{x^2/2} = K e^{x^2/2}$$

where $(K = \pm e^C)$ is an arbitrary constant.

Second-Order Example

Solve $y'' - 3y' + 2y = 0$.

Solution:

Characteristic equation:

$$(r^2 - 3r + 2 = 0)$$

Factor:

$$(r - 1)(r - 2) = 0$$

Roots:

$$(r = 1, 2)$$

General solution:

$$(y(x) = C_1 e^x + C_2 e^{2x})$$
